

Art Unit 2653
Serial No. 10/080,849

PATENT
Attorney Docket No.: K35A1056

IN THE CLAIMS:

1. (Previously presented) A head stack assembly for a disk drive having a disk, the head stack assembly comprising:

a body portion;

an actuator arm cantilevered from the body portion;

a hinge, a first surface of the hinge being coupled to the actuator arm;

a load beam having a first end and a second end, the first end including a load beam surface that faces and contacts a second surface of the hinge, the second surface facing away from the first surface;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

2. (Original) The head stack assembly of Claim 1, further including a mount plate attached to the actuator arm, the hinge being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.

3. (Original) The head stack assembly of Claim 1, wherein the hinge has a thickness that is greater than 0.05 mm.

4. (Original) The head stack assembly of Claim 1, wherein the load beam has a thickness that is greater than 0.12 mm.

5. (Previously presented) The head stack assembly of Claim 1, wherein the first surface includes

Art Unit 2653

PATENT
Attorney Docket No.: K35A1056

a first convex portion defining a first radius of curvature, adjacent the actuator arm, and adjacent

a first concave portion of the first surface, defining a second radius of curvature , adjacent,

a second convex portion of the first surface, defining a third radius of curvature, adjacent

a second concave portion of the first surface, adjacent the first end.

6. (Previously presented) A disk drive, comprising:

a disk having a recording surface;

a head stack assembly, including:

a body portion;

an actuator arm cantilevered from the body portion;

a hinge, a first surface of the hinge being coupled to the actuator arm;

a load beam having a first end and a second end, the first end including a load beam surface that faces and contacts a second surface of the hinge, the second surface facing away from the first surface;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

7. (Original) The disk drive of Claim 6, further including a mount plate attached to the actuator arm, the hinge being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.

Art Unit 2653
Serial No. 10/080,849

PATENT
Attorney Docket No.: K35A1056

8. (Previously presented) The disk drive of Claim 6, wherein the hinge has a thickness that is greater than 0.05 mm and the load beam has a thickness that is greater than 0.12 mm.

9. (Previously presented) The disk drive of Claim 6, wherein the first surface includes

a first convex portion defining a first radius of curvature, adjacent the actuator arm, and adjacent

a first concave portion of the first surface, defining a second radius of curvature, adjacent,

a second convex portion of the first surface, defining a third radius of curvature, adjacent

a second concave portion of the first surface, adjacent the first end.

10. (Previously presented) The disk drive of Claim 9, wherein the third radius is greater than the second radius.

11. (Previously presented) A head gimbal assembly for a head stack assembly of a disk drive, comprising:

a hinge having a first hinge surface and a second hinge surface;

a mount plate coupled to the first hinge surface;

a load beam having a first end and a second end, the first end including a load beam surface that faces and contacts the second hinge surface, the second hinge surface facing away from the first hinge surface;

a gimbal coupled to the second end of the load beam, and

Art Unit 2653
Serial No. 10/080,849

PATENT
Attorney Docket No.: K35A1056

a slider coupled to the gimbal.

12. (Original) The head gimbal assembly of Claim 11, wherein the hinge has a thickness that is greater than 0.05 mm.

13. (Original) The head gimbal assembly of Claim 11, wherein the load beam has a thickness that is greater than 0.12 mm.

14. (Original) The head gimbal assembly of Claim 11, wherein the hinge includes a radius geometry that defines a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

15. (Previously presented) A suspension for a head stack assembly of a disk drive, the suspension comprising:

a hinge, having a first hinge end and a second hinge end;

a mount plate coupled to the first hinge end;

a load beam having a first load beam end and a second load beam end, the first load beam end being coupled to the second hinge end; and

a gimbal coupled to the second load beam end;

the hinge including a first surface having

a first convex portion defining a first radius of curvature, adjacent the first hinge end, and adjacent

a first concave portion of the first surface, defining a second radius of curvature , adjacent,

Art Unit 2653

PATENT
Attorney Docket No.: K35A1056

a second convex portion of the first surface, defining a third radius of curvature,

adjacent

a second concave portion of the first surface, adjacent the second hinge end.

16. (Original) The suspension of Claim 15, wherein the hinge has a thickness that is greater than 0.05 mm.

17. (Original) The suspension of Claim 15, wherein the load beam has a thickness that is greater than 0.12 mm.

18. (Previously presented) The suspension of Claim 15, wherein the third radius is greater than the second radius.

19. (Previously presented) The suspension of claim 15, wherein the first surface is coupled to the mount plate.

20. (Previously presented) The suspension of Claim 19, wherein the hinge further comprises a second surface opposing the first surface and the second surface faces and is in contact with a surface of the load beam.

21. (Original) The suspension of Claim 19, wherein the load beam has a thickness that is greater than 0.12 mm.

22. (Previously presented) The suspension of Claim 19, wherein the first radius is closer to the mount plate than the second radius, the second radius is closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

PATENT
Attorney Docket No.: K35A1056

23. (Previously presented) A head gimbal assembly for a head stack assembly of a disk drive, the head stack assembly including a body portion, an actuator arm cantilevered from the body portion, the disk drive having a disk, the head gimbal assembly comprising:

a load beam having a first end and a second end, the first end defining an integral hinge portion, the hinge portion defining a radius geometry that includes at least three radii of curvatures configured to lower load beam toward the disk such that a first surface of the hinge portion defines at least two concave portions and at least two convex portions, the first surface of the hinge portion being coupled to the actuator arm;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

24. (Previously presented) The head gimbal assembly of Claim 23, wherein the hinge portion has a thickness that is greater than 0.05 mm.

25. (Original) The head gimbal assembly of Claim 23, wherein the load beam has a thickness that is greater than 0.12 mm.

26. (Original) The head gimbal assembly of Claim 23, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

27. (Previously presented) A head stack assembly for a disk drive having a disk, the head stack assembly comprising:

a body portion;

an actuator arm cantilevered from the body portion;

a load beam having a first end and a second end, the first end defining an integral hinge portion, the hinge portion defining a radius geometry that includes at least three radii of curvatures configured to lower load beam toward the disk such that a first surface of the hinge portion defines at least two concave portions and at least two convex portions, the first surface of the hinge portion being coupled to the actuator arm;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

28. (Previously presented) The head stack assembly of Claim 26, further including a mount plate attached to the actuator arm, the hinge portion being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.

29. (Previously presented) The head stack assembly of Claim 27, wherein the hinge portion has a thickness that is greater than 0.05 mm.

30. (Original) The head stack assembly of Claim 27, wherein the load beam has a thickness that is greater than 0.12 mm.

31. (Original) The head stack assembly of Claim 27, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

PATENT
Attorney Docket No.: K35A1056

32. (Previously presented) A disk drive, comprising:
- a disk having a recording surface;
- a head stack assembly, including:
- a body portion;
- an actuator arm cantilevered from the body portion;
- a load beam having a first end and a second end, the first end defining an integral hinge portion, the hinge portion defining a radius geometry that includes at least three radii of curvatures configured to lower load beam toward the disk such that a first surface of the hinge portion defines at least two concave portions and at least two convex portions, the first surface of the hinge portion being coupled to the actuator arm;
- a gimbal coupled to the second end of the load beam, and
- a slider coupled to the gimbal.
33. (Previously presented) The disk drive of Claim 32, further including a mount plate attached to the actuator arm, the hinge portion being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.
34. (Previously presented) The disk drive of Claim 32, wherein the hinge portion has a thickness that is greater than 0.05 mm.
35. (Original) The disk drive of Claim 32, wherein the load beam has a thickness that is greater than 0.12 mm.
36. (Original) The disk drive of Claim 32, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first

PATENT
Attorney Docket No.: K35A1056

radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

37. (Previously presented) A head stack assembly for a disk drive having a disk, the head stack assembly comprising:

a body portion;

an actuator arm cantilevered from the body portion;

a hinge defining a radius geometry, the radius geometry including at least three radii of curvatures such that a first surface of the hinge defines at least two concave portions and at least two convex portions, the hinge being coupled to the actuator arm;

a load beam having a first end and a second end, the first end being coupled to the hinge;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

38. (Original) The head stack assembly of Claim 37, further including a mount plate attached to the actuator arm, the hinge being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.

39. (Previously presented) The head stack assembly of Claim 37, wherein the hinge further comprises a second surface opposing the first surface and the second surface faces and is in contact with a surface of the load beam.

40. (Previously presented) The head stack assembly of Claim 37, wherein the first surface faces and is in contact with a surface of the load beam.

Art Unit 2653

PATENT
Attorney Docket No.: K35A1056

41. (Original) The head stack assembly of Claim 37, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

42. (Previously presented) A disk drive, comprising:

a disk having a recording surface;

a head stack assembly, including:

a body portion;

an actuator arm cantilevered from the body portion;

a hinge defining a radius geometry, the radius geometry including at least three radii of curvatures such that a first surface of the hinge defines at least two concave portions and at least two convex portions, the hinge being coupled to the actuator arm;

a load beam having a first end and a second end, the first end being coupled to the hinge;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

43. (Original) The disk drive of Claim 42, further including a mount plate attached to the actuator arm, the hinge being coupled to the actuator arm via the mount plate, the mount plate having a thickness that is greater than 0.22 mm.

Attorney Docket No.: K35A1056

44. (Previously presented) The disk drive of Claim 42, wherein the hinge further comprises a second surface opposing the first surface and the second surface faces and is in contact with a surface of the load beam.

45. (Previously presented) The disk drive of Claim 42, wherein the first surface faces and is in contact with a surface of the load beam.

46. (Original) The disk drive of Claim 42, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

47. (Previously presented) A head gimbal assembly for a head stack assembly of a disk drive, the head stack assembly including a body portion, an actuator arm cantilevered from the body portion, the disk drive having a disk, the head gimbal assembly comprising:

a hinge defining a radius geometry, the radius geometry including at least three radii of curvatures such that a first surface of the hinge defines at least two concave portions and at least two convex portions, the hinge being coupled to the actuator arm;

a load beam having a first end and a second end, the first end being coupled to the hinge;

a gimbal coupled to the second end of the load beam, and

a slider coupled to the gimbal.

PATENT
Attorney Docket No.: K35A1056

48. (Previously presented) The head gimbal assembly of Claim 47, wherein the hinge further comprises a second surface opposing the first surface and the second surface faces and is in contact with a surface of the load beam.

49. (Previously presented) The head gimbal assembly of Claim 47, wherein the first surface faces and is in contact with a surface of the load beam.

50. (Original) The head gimbal assembly of Claim 47, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.

51. (Previously presented) A suspension for a head stack assembly of a disk drive, the suspension comprising:

a hinge defining a radius geometry, the radius geometry including at least three radii of curvatures such that a first surface of the hinge defines at least two concave portions and at least two convex portions;

a mount plate coupled to the first surface;

a load beam having a first end and a second end, the first end being coupled to the hinge, and

a gimbal coupled to the second end of the load beam.

52. (Original) The suspension of Claim 51, wherein the hinge has a thickness that is greater than 0.05 mm.

Art Unit 2653
Serial No. 10/080,849

PATENT
Attorney Docket No.: K35A1056

53. (Original) The suspension of Claim 51, wherein the load beam has a thickness that is greater than 0.12 mm.

54. (Original) The suspension of Claim 51, wherein the radius geometry includes a first radius of curvature, a second radius of curvature and a third radius of curvature, the first radius being closer to the mount plate than the second radius, the second radius being closer to the mount plate than the third radius, and wherein the third radius is greater than the second radius.
